## **Traffic Analysis Supporting Data for Alternatives Analysis**

## Traffic Diversion:

Under each closure alternative, vehicles on US 14 were assumed to divert to the nearest interchange either west or east of the closure.

The diverted volume was determined using travel times from Google Maps with the route diversion curve, and engineering judgement based on the surrounding land usage.

Daily volumes were developed using the peak hour volumes approaching and exiting the intersection on each leg. The existing a.m. and p.m. peak hour percentages were 11 percent and 12 percent (23 percent total). The assumed 2040 a.m. and p.m. peak hour percentages were 10 percent and 11 percent (21 percent total) – assumed peak spreading.

## East-West Local Roadways

Roadways and segments highlighted in Table 3 indicate parallel routes along US 14 in which traffic may divert under each alternative. The highlighted rows assume a “worst case scenario” where 100 percent of the daily traffic volume would utilize the same diversion route. For the segment of US 14 between 280<sup>th</sup> Ave and CSAH 5 there are two identified parallel routes that traffic may divert onto and three parallel routes for the segment of US 14 between CSAH 5 and 10<sup>th</sup> Ave. Under each alternative, Table 3 summarizes the anticipated added daily traffic as well as the anticipated total daily traffic along the parallel local route.
